

Clerk of the Board of Supervisors

Facility Services

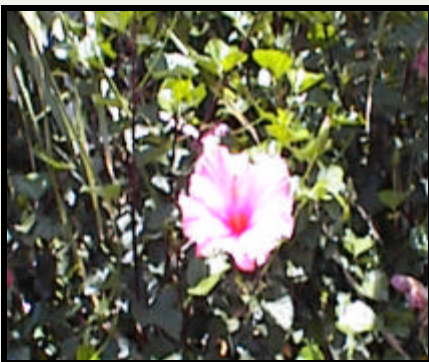

Hibiscus plants are one of many colorful tropical flora planted on the County Administration Center grounds. They require full sun and good air circulation with consistent moisture, but they don't do well in a soggy environment. They thrive well in

HIBISCUS

most types of gardens and grow most effectively if planted singly. Their glossy green leaves provide a nice contrast to the bright yellow or pink flowers in their sun-drenched, tropical environment. Hibiscus are prolific bloomers with incredibly large flowers that emerge in late Spring. The blooms are striking, being 5 to 10-inches in diameter, with ruffled edges. Hibiscus are favorite head adornments of Tropical Islanders. This signifies natural

beauty in a tropical paradise.
